ABSTRACT

A nitride-based semiconductor device according to the includes a semiconductor multilayer invention present structure supported on a substrate structure 101 The principal surface of electrical conductivity. substrate structure 101 has at least one vertical growth region, which functions as a seed crystal for growing a nitride-based semiconductor vertically, and a plurality of growth regions for allowing the nitride-based lateral semiconductor that has grown on the vertical growth region to grow laterally. The sum $\Sigma \, {\tt X}$ of the respective sizes of the vertical growth regions as measured in the direction pointed by the arrow ${\bf A}$ and the sum $\Sigma \, {\bf Y}$ of the respective sizes of the lateral growth regions as measured in the same direction satisfy the inequality $\Sigma X/\Sigma Y > 1.0$.
